MARMARA SEA EARTHQUAKE (WESTERN TURKEY) (ML=5.1)

An earthquake with magnitude ML=5.1 occurred at local time 23:54 on June, 07, 2012. Epicentral coordinates of the earthquake was determined as 40.86 N - 27.90 E with focal depth 26.90 km. The magnitude of earthquake was identified with AFAD National Seismological Observation Network and Kandilli Observatory and Earthquake Research Institute. After this earthquake, 23 earthquakes were determined with magnitude range 1.9 – 3.2 in first 10 hours (Fig.1).

This earthquake was also felt in, Balıkesir, Tekirdağ, İstanbul, Yalova, Bursa ve Kocaeli and it didn't caused loss of life and damaged.

Focal Mechanism Solutions performed by considering first motion direction of P wave and moment tensor solution of MI=5.1 earthquake is emerged from strike slip faulting with normal component (Fig.2). The fault which caused earthquake is located in the middle of Tekirdağ hollowness and middle hollowness of western part of North Anatolian Fault Zone (Fig.3)

This region is very active in terms of seismicity. Marmara region has been exposed to destructive earthquakes during the historical and Instrumental times. Destructive earthquakes that occurred in the last century are given as; 1912 M=7.4, 1942 M=5.7 Marmara Sea, 1963 M=6.3 Çınarcık, 1964 M=7.0 Manyas, 1988 M=5.1 North Marmara, 1999 M=7.4 Kocaeli and 2011 MI=5.2 earthquakes (Fig.4,5).

June 07, 2012 Marmara Sea Earthquake was recorded by accelerometers at 46 different locations within National Strong Ground Motion Observation Network operated by Earthquake Department at Disaster and Emergency Management Presidency of Turkey. Peak ground acceleration values recorded at Tekirdağ Marmara Ereğlisi station which is located at nearest distance (about 13 km) to epicenter of this earthquake are 55.6 gal in EW direction, 28.9 gal in NS direction and 1.61 gal in up-down direction (Table 1, Fig. 6).

MARMARA SEA EARTHQUAKE (WESTERN TURKEY) (MI=5.1)

Peak ground acceleration and seismic intensity values that can be created by June,07, 2012 Marmara Sea earthquake in the earthquake-hit area and its vicinity are estimated and the maps showing the spatial distribution of these values are prepared (Fig.7,8).

Earthquake activity of this region (and all of Turkey) has been observed in Disaster and Emergency Management Presidency, Earthquake Department Data Center Ankara 7 days/24 hours with 205 Seismic station and 371 accelerometer. Obtained results are shared with public, press and relevant authorized.
